

# System Imaging with KIWI

Jan-Christoph Bornschlegel <jcborn@suse.de>

SUSE Linux Products GmbH - Build Service Team

12th February 2008

# System Imaging with kiwi – Overview

- 1 Theory and History
  - Introduction
  - How does kiwi work?
  - The Configuration Directory
- 2 A Real Life Example
  - Situation
  - Solution
- 3 What else?
  - Autobuild System
  - Product Creation now and then
- 4 Questions and Answers

# where are we

- 1 Theory and History
  - Introduction
    - How does `kiwi` work?

- 2 A Real Life Example
  - Situation
  - Solution
- 3 What else?
  - Autobuild System
  - Product Creation now and then
- 4 Questions and Answers

# What kiwi is and what it's not

KIWI is:

- A command line based toolkit
- Usable as part of a process chain
- Usable as base tool for a high level application

KIWI is not:

- A product

# kiwi history

- originated by **Marcus Schäfer**
- original purpose was creating “system on a stick”
- **James Willcox** (snorp) joins active development for Thin Client (SLETC)
- **Jigish Gohil** (CyberOrg) joins active development: LTSP project
- I join active development for Autobuild extension

I'll get back to the last point later

# Current project status

Used for the following products:

- SLEPOS – SuSE Linux Point of Sale
- SLETC – SuSE Linux Thin Client
- Hardware vendors for preload images

Community projects:

- Developers who deliver Live DVDs (KDE, openSUSE, ...)
- users who want to make images containing their application
- ... ? (You tell me)

How does `kiwi` work?

How does `kiwi` work?

# Help Wanted!

Documentation is available throughout the web in various places

- <http://www.suse.de/~jcborn/kiwi-links.html>
- official documentation delivered with `kiwi` package

# Setting up the buildhost

- Install **kiwi**, **kiwi-tools** and **kiwi-desc-\*** packages
- create an image description file *config.xml*, or
- get and modify an existing image description

How does kiwi work?

# Buildsystem overview

How does `kiwi` work?

## Buildsystem overview II

- Package repositories (local, network)
- Configuration file(s)
- Buildhost with sufficient resources (esp. hdd)

# where are we

- 1 Theory and History
  - Introduction
  - How does `kiwi` work?
  - **The Configuration Directory**
- 2 A Real Life Example
  - Situation
  - Solution
- 3 What else?
  - Autobuild System
  - Product Creation now and then
- 4 Questions and Answers

# Contents of the Configuration Directory

- `config.xml` contains every necessary image information (packages, repositories, settings, ...)
- `config.sh` customise the image after the packages are installed
- `image.sh` ditto
- `root/` contains overlay files which are included in the image or needed in scripts
- `other` special YaST files and others

The main thing to do is tweaking the *config.xml*.

# where are we

- 1 Theory and History
  - Introduction
  - How does kiwi work?
  - The Configuration Directory
- 2 A Real Life Example
  - **Situation**
  - Solution
- 3 What else?
  - Autobuild System
  - Product Creation now and then
- 4 Questions and Answers

# Requirements and Regressions

- You developed a distributed application as Diploma Work (for example)
- You have to give a “public” demonstration
- You have virtually no control over the hardware for the demo

# where are we

- 1 Theory and History
  - Introduction
  - How does kiwi work?
  - The Configuration Directory
- 2 A Real Life Example
  - Situation
  - **Solution**
- 3 What else?
  - Autobuild System
  - Product Creation now and then
- 4 Questions and Answers

# One Possible Solution

Your program is available as RPM package:

- add a plain RPM folder to your repositories
- add the package name to the <packages> section
- Build your image

## One Possible Solution II

Your program is *not* available as RPM package:

- Get a BuildService account and package it ;)
- put all needed files into your image manually
- Build your image

# Repository Configuration Example

# where are we

- 1 Theory and History
  - Introduction
  - How does kiwi work?
  - The Configuration Directory
- 2 A Real Life Example
  - Situation
  - Solution
- 3 What else?
  - **Autobuild System**
  - Product Creation now and then
- 4 Questions and Answers

# Purpose

- Autobuild is current internal package and media factory
- openSUSE BuildService will be the next generation package factory
- kiwi can not yet create installation sources
- not yet...

# How it works

Autobuild is a distributed system

- Build clients build single RPMs based on a central scheduler and source base
- every employee's machine can (and should) be a build host
- scheduler collects built rpm files to internal "full trees" for each codebase and architecture
- metadata is created

# where are we

- 1 Theory and History
  - Introduction
  - How does kiwi work?
  - The Configuration Directory
- 2 A Real Life Example
  - Situation
  - Solution
- 3 What else?
  - Autobuild System
  - **Product Creation now and then**
- 4 Questions and Answers

# Current Product Creation

- full trees for target architectures are sync'd to dedicated machines
- rpm files are selected and collected to one repository
- metadata for this particular repository is created
- finally all sorts of media are made:
  - ftp repositories
  - CD, DVD, torrent, . . .

# Product Creation with kiwi

Collecting the target repository must be integrated into kiwi.

- Expansion of the config.xml syntax
- add module for repository creation
- allow priority value for repositories
- allow exceptions
- implement script hooks

Autobuild knowledge is necessary to create package lists and scripts

# Questions?

If your time (or hunger) allows. . .

## Another talk is over

Thank you for your attention!  
See you on

- `irc.freenode.net #opensuse-kiwi`
- for kiwi issues: `<kiwi-users@lists.berlios.de>`
- for packaging issues:  
`<opensuse-packaging@opensuse.org>`
- Bugzilla for kiwi: product “opensuse.org”, component “system imaging”
